

Student Name: John Doe

1. Object-Oriented Programming (OOP) is a programming paradigm based on objects and classes. It focuses on concepts like encapsulation, inheritance, polymorphism, and abstraction. OOP helps in organizing code and improving reusability.

2. A database is an organized collection of data stored electronically. SQL databases are relational and use structured query language. NoSQL databases are non-relational and handle unstructured data more flexibly.

3. HTTP is a protocol used for communication between client and server. The client sends a request and the server responds with data. It follows a request-response model and works over TCP/IP.

4. Machine Learning is a field of AI that allows systems to learn from data. Supervised learning uses labeled data while unsupervised learning uses unlabeled data to find hidden patterns.

5. REST API is an architectural style for designing networked applications. It uses HTTP methods like GET, POST, PUT, DELETE to perform operations.
